

1 **ABSTRACT**

2 The described system and procedure provide for storing device-specific UI
3 information into firmware on a USB device. Responsive to receiving a host
4 specific device request, the USB device communicates the device specific
5 information to a requestor such as an operating system or other computer program
6 application. Thus, the system and procedure allow OEMs/IHVs to provide
7 additional brand specific information in a USB device in a format that can be
8 determined by an operating system. Moreover, the system and procedure allows
9 OEMs/IHVs to store device-specific UI information in the firmware of a USB
10 device such that installation media does not need to be distributed with each USB
11 device to specify the device-specific information
